FRANCE-IX AND ACORUS NETWORKS PARTNER ON CYBERSECURITY

France-IX and Acorus Networks, a cybersecurity specialist, have partnered to provide advanced cybersecurity solutions.

As part of the agreement, Acorus Networks will join the France-IX Marketplace giving members of the France-IX peering community access to Acorus Networks security solutions, which doesn't require the installation of hardware on premise.

"We are pleased to welcome to our Marketplace, both Acorus Networks and its co-founder, Raphaël Maunier, especially as he was a founder-member of France-IX when he was CTO of Neo Telecoms. Now members can optimize their peering connection with competitively priced, advanced anti-DDoS solutions, efficiently accessed via their peering connection, which is a valuable addition to the range of services currently available," said Franck Simon, president of France IX Services.

Acorus Networks will offer three complementary services in roughly 1-2 business days, directly from its France-IX Marketplace 100Gbps port to any peering member's France-IX port via rapid VLAN provisioning. The services include: a DDoS

mitigation service; a IP Transit service (from 100Mbps to 100Gbps); DDoS protection specifically for http/https Web sites.

"We are also delighted that Acorus Networks is joining the leading Internet networks who have chosen to increase their France-IX peering capacity via 100Gbps ports, which has become the new interface for large-scale IP networks in recent years," added Simon.
